

Switch Voltage, Switching Current and Power Rating

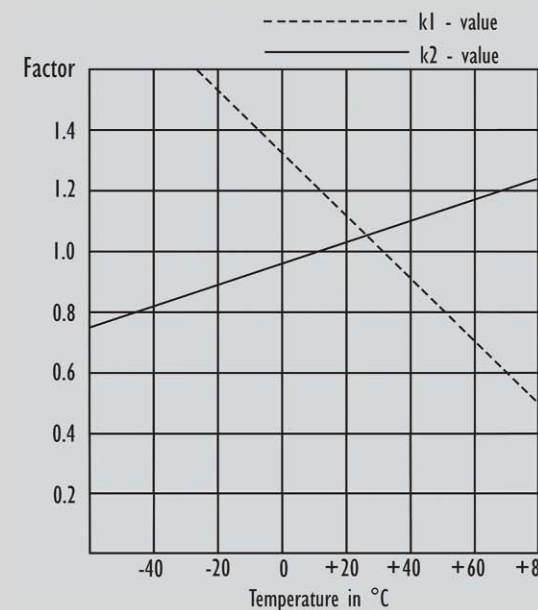

Power Rating

The listed Values for switching voltage, switching current, and power rating are absolute limits. If any of these values is exceeded, a reduction of life expectancy will result (see following power diagram).

Operating Temperature

The operating temperature is the internal temperature of the relay (ambient temperature plus self heating). If relays are operating at higher ambient temperatures than +20°C, the pull-in voltage and the maximum coil voltage must be calculated as follows:
 Pull-in voltage = Pull-in voltage at 20°C x k1.
 Maximum coil voltage = Max. coil voltage 20°C x k2.
 When mounting relays side by side, a gap of approximately half the relay width is recommended to avoid magnetic interference from one relay to another.

Switching Time

This is defined as, the pull-in time including the bounce time at nominal voltage and 20 Hz: 1.5 - 3.5ms, and the release time (without diode) at nominal voltage and 20 Hz: 0.4 - 1.5ms.

HOW TO ORDER HIGH VOLTAGE RELAYS

3392 - 1270 - 12 - 6
 Contact Code Termination Style Coil Voltage Version Number

Note: All parts of the order code must be completed

High Voltage Reed Relays

DESCRIPTION

Reed Relays consist of a reed switch and a coil fitted into a housing, which could be plastic, metal, or moulded. Compared with electromechanical relays, reed relays generally have a faster response time, lower coil consumption, and are smaller in size. Furthermore, the switch is sealed in a dry, inert atmosphere, preventing the ingress of contaminants.

OPERATION

High Voltage Relays have outstanding performance in insulation and stand-off voltage. Energizing the coil operates a reed switch causing the contacts to open or close. It is important that the switch is not overloaded by applying loads in excess of the switch ratings. For details on switch loads refer to the reed relay specifications, and the reed switch catalogue, available from our sales offices.

General Parameters

All characteristics for pull-in voltage, drop-out voltage, and coil resistance are at 20°C ±3°C ambient temperature. For other temperatures see diagram 'Operating Temperature.'

Contact Resistance

Initial value at nominal voltage is measured by Kelvin test method at 20V / 100mA.

Soldering

During Soldering make sure no mechanical stress is applied to the terminals because damage to the internal reed switch may occur.

Insulation Resistance

The insulation resistance is measured with a Tera Ohmmeter at 500VDC. The ambient climate is 20°C ±3°C and 50% relative humidity.

Dielectric Strength

Tested in a radiation (eg. light, x-ray) free environment by applying a DC voltage across the open contacts, between adjacent contacts and between the coil and contact. The test current is 50µA. The unused contacts should not be connected during the test.

Shock and Vibration

During shock and vibration tests the relays must be energized with nominal voltage. The contact should not open or close longer than 10µs. Vibration stability: 20g/50 - 500Hz. Shock stability: 35g/11ms half sine wave.

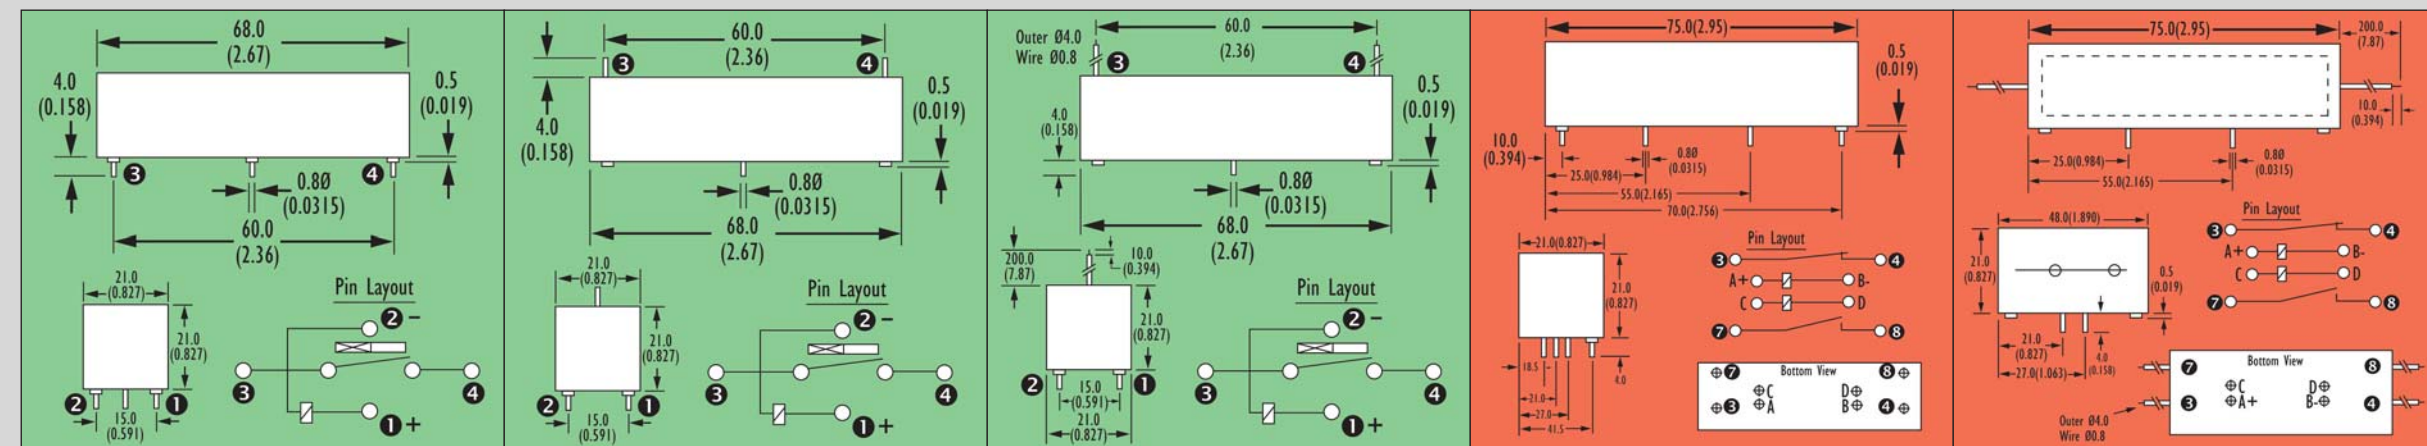

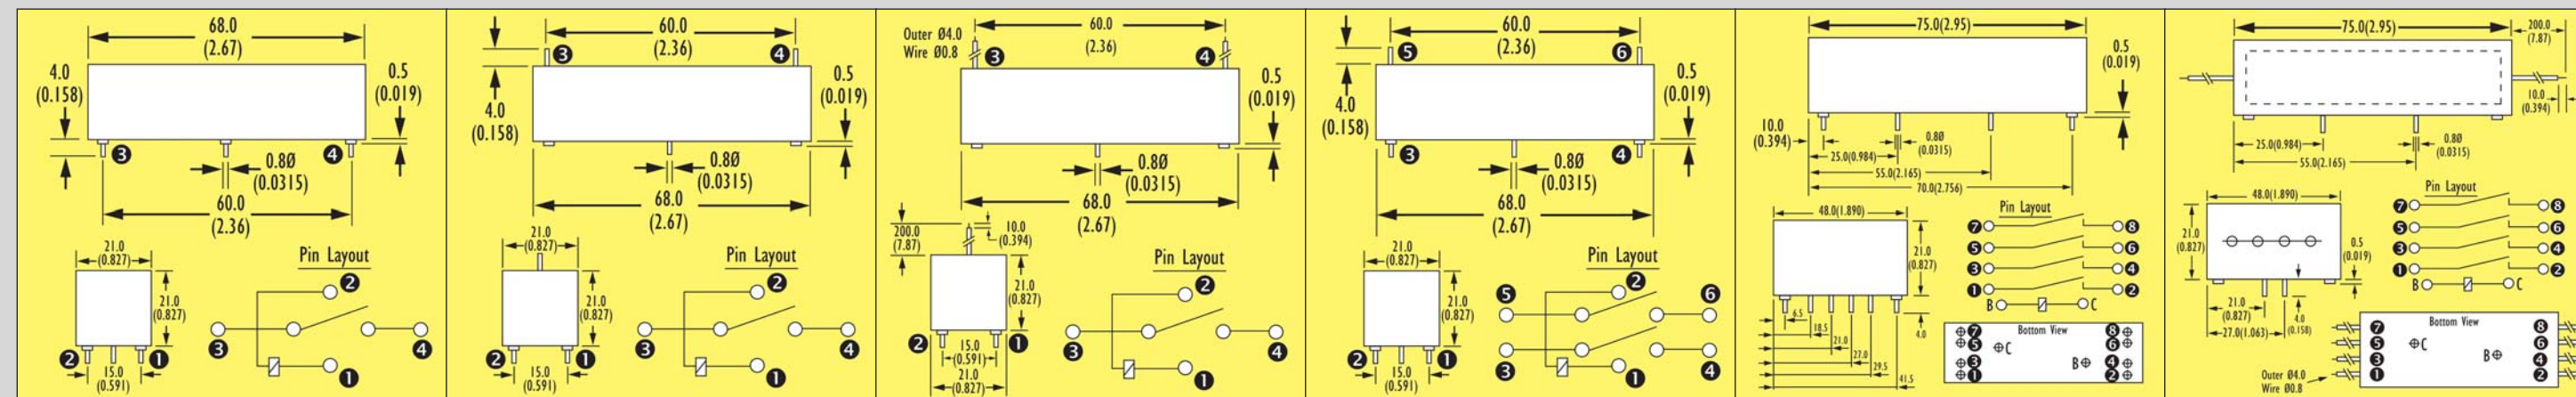

Life Expectancy:

The life expectancy of a reed relay is dependent upon the load being switched. At maximum rated loads life expectancy is approximately 10⁶ switching cycles. Lower load ratings can increase the life expectancy up to 5x10⁸ operations. The mechanical life expectancy can reach at least 10⁹ operations. Through the switching of inductive, capacitive, and lamp loads, the life expectancy is considerably reduced due to exceeding the specified maximum current.

Contact Capacitance (Typical Values)

Across open contacts	0.8 - 1.2 pF
Between open contact and coil	1.4 - 2.2 pF
Between closed contacts and coil	2.3 - 3.5 pF
